

Slocum Recovery Procedure (Remote Pilot)

Overview

This guide describes the standard actions performed by a remote pilot before, during, and after recovery of a Slocum glider.

Consider:

- Environmental conditions
- Vessel traffic
- Local operating conditions
- Glider battery health

Adjust timing according to the situation. The glider should ideally already be drifting on the surface before the field team arrives on site.

1. Pre-Recovery Coordination

Before recovery, discuss the following with the field team:

- Estimated arrival time on site
 - Estimated recovery time
 - Potential schedule changes
 - Communication method
 - Frequency of position updates
 - Glider configuration (call-in interval, strobe operation, etc.)
-

2. Catch the Glider on the Surface

Several hours before recovery:

- Catch the glider on the surface
- Shorten the surfacing interval by modifying:
