

Slocum One-Pager

Quick-reference notes for common Slocum operations. This page grows over time – add notes as new important reminders are identified.

Power-up

 **Never power up a shallow glider without a vacuum.**

External Power

 **Never power on a glider with more than 16.3 VDC from an external power supply.**

Powering Down

 **Never pull the green plug or external power without first issuing `exit` and getting the glider's confirmation – it can corrupt the file system.**

If the emergency battery is left latched (main battery disconnected without a clean `exit`), the BMS board sounds a buzzer until the glider is powered back up and exited properly.

Lab-Only Modes

 **Never deploy a glider that is still in `lab_mode`.**

 **Never exit to Pico on a deployed glider.**
