

Seaglider Deployment Procedure

For field teams and vessel operators

This document covers assembling a Seaglider from its shipping crates, running self-test, and launching from a small boat. It complements the [Seaglider Deployment Checklist](#), which covers field-kit and pilot sign-off in more general terms — this page walks through one real field deployment in more physical detail.

Source

Paraphrased from a community Seaglider field deployment write-up, including photos from that deployment. Menu wording and self-test flow will vary slightly by basestation/firmware version — confirm against your own glider's menus.

Tools and Equipment

- Zip ties (preferably long ones)
- Cutter
- Duct tape
- 30 m or longer line (preferably light)
- Laptop
- Satellite phone
- The glider toolbox (shipped in the same box as the glider)

Assembly (if needed)

In case the glider arrives in two boxes: the pressure hull and forward fairing in one, the aft fairing in a smaller second box. Assembly is a two-person job.
