

Maintenance

Maintenance keeps a glider ready for its next mission: what to check before every deployment, what to service after every recovery, and what only needs attention on its own schedule (pump service life, O-ring dry-out, sacrificial anodes). Most of the detailed how-to already lives on each component's page under [Glider Components](#) – the schedules here pull those facts together by **when**, not by **what**, and link back to the component pages for the full procedure.

Platforms

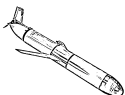

Seaglider

Maintenance schedule for the Seaglider platform.
