This review summarizes nearly two decades of glider observing experience across Atlantic Canada — Memorial University, the Coastal Environmental Observation Technology and Research (CEOTR) group, and Fisheries and Oceans Canada (DFO), operating since 2005, 2010, and 2017 respectively. It has three goals:

1. Give new and emerging glider users guidance and considerations for developing a glider program.
2. Review the literature on sensor development for gliders and their scientific use.
3. Highlight mission scenarios with enough practical detail to support actually operating gliders in the field.

What It Covers

- Glider operators active in Atlantic Canada and their main projects and study areas.
- Regional oceanography: the Newfoundland Shelf, the Gulf of St. Lawrence, and related deployment areas.
- **Lessons learned operating gliders in the region** — understanding mission costs, glider mission planning, power management, and glider emergencies.
- Glider sensor payloads and data streams, including standard corrections used across Canadian glider groups.
