

Slocum Piloting Checklist

A daily pilot log. Work down the list each piloting day, recording the value from the indicated source and flagging anything outside its normal range.

Source

The core daily-log format below is this site's own; the Environment section and first-piloting-day/weekly items are paraphrased from a NorGliders / University of Bergen (UiB) piloting checklist.

Pilot: _____ Glider S/N: _____ Date (UTC): _____

First piloting day of a deployment

- ☐ Deployment files were prepared and reviewed before launch:
`sg_calib_constants.m` -equivalent config, `cmdfile`, `targets`, `.paggers`, and the science file
- ☐ Pre-deployment self-test reviewed (`.cap` / `.eng` / `.log` files against pass/fail guidelines)
- ☐ Pre-launch check confirmed — glider calling in and responding to `$QUIT`
- ☐ First few dives run one at a time (`$QUIT` between each) while trimming `$C_VBD`, `$C_PITCH`, `$PITCH_GAIN`, `$C_ROLL_DIVE`, `$C_ROLL_CLIMB`
- ☐ Compass calibration scheduled — data is unreliable until it's done
- ☐ Safety parameters revisited a few days in, once the glider is behaving well (`$N_NOCOMMS`, `$NOCOMM_ACTION`, `$CAPUPLOAD`, `$GO`)
- ☐ `cmdfile` trimmed down to the parameters that actually need to be sent each dive

Confirm **Science** and **Navigation** against the campaign plan, and create a new *important* log entry with a fresh campaign summary for reference.
