

G3 Piloting Primer

[Download the primer \(PDF\)](#)

Source

SL16 – User Notes – G3 Piloting Primer, NorGliders / University of Bergen. A screen-by-screen companion to the [Mission Files](#) and [Slocum Piloting Checklist](#) pages – it walks through the same territory from the SFMC UI rather than the underlying `.ma` / `.mi` files.

This is a visual, click-by-click walkthrough of piloting a Slocum G3 through **SFMC** rather than a reference of concepts or parameters. It's the document to open the first time you sit down at a new SFMC dashboard, not the one to search for a specific parameter.

What It Covers

- **Dashboard summary** – reading the map, comms plot, and the day-to-day checklist of what to glance at (last call-in, progress, XML script state, current waypoint).
- **Deployment details** – the summary/map, surfacings, device status, and surface sensor values views, with the key sensors worth plotting and what a healthy range looks like.
- **The glider terminal** – the control keys (`Ctrl-C` / `Ctrl-E` / `Ctrl-F` / `Ctrl-R` / `Ctrl-W` / `Ctrl-T`), sending files via `to-glider` / `to-science`, and pausing/resuming an XML script to send manual commands safely.
- **Waypoint creation** – the specific SFMC menu path for editing a mission plan and generating a new `goto` file, including a UI bug to route around (don't use *Options* → *Access Mission Plan*).
