

Post-Recovery Maintenance Checklist

Maintenance to carry out on a Slocum G3 glider after recovery. Work through it as soon as practical after the glider is out of the water — salt left to dry promotes corrosion and can inhibit moving parts on the next power-up.

Source

Compiled from the *Slocum G3 Glider Operators Manual* (Rev. 1) and the *Slocum G3 Glider Maintenance Manual* (Rev. A). Defer to the official Teledyne documentation for your specific glider configuration.

Glider S/N: _____ Mission: _____ Date (UTC): _____

Engineer: _____

1. On Deck / Immediately After Recovery

- ☐ Secure the glider on its cart or cradle *never leave it where it can roll off a surface*
- ☐ Note recovery date/time and final GPS position
- ☐ Power down the glider properly **before** removing the green plug

Deflate the air bladder before removing the aft tail cowling

With the cowling off, the bladder is unsupported and can over-inflate. Deflate it first: `put c_air_pump 0` to open the solenoid and release the external bladder.

2. Data & Power

- ☐ Offload all engineering and science data from the glider
