

Primary Batteries

Slocum gliders run on one of several **primary (non-rechargeable)** pack types: **alkaline**, **3S lithium primary**, and the newer **4S lithium primary** — each available in standard and extended (energy-bay) configurations. Choosing a type is a trade-off between cost, energy, and handling/shipping burden.

Source

Paraphrased and consolidated from the *Slocum Glider Operators Manual*, the Teledyne Webb Research (TWR) user forum, and the UG2 community Slack. Capacity and derating figures evolved over the years and depend on configuration — treat the authoritative values as those in your glider's `autoexec.mi` and the current TWR specifications, and contact Glider Support before changing abort settings. See also the capacities figure on the [Batteries](#) page.
